# COST AND MANAGEMENT ACCOUNTING-II <br> JOINT PRODUCT \& BY PRODUCT <br> SEMESTER-IV 

## JOINT PRODUCTS AND BY-PRODUCTS

## INTRODUCTION

Joint products are defined by CIMA( Chartered Institute Of Management Accountants) as "two or more products produced by the same process and separated in processing, each having a sufficiently high saleable value to merit recognition as a main product".

By-products is defined by CIMA as "output of some value produced incidentally in manufacturing something else (main product)".

It should be noted that by-products are differentiated from joint products only by degree of economic importance. What is a by-product today may be a main product, a joint product, or scrap tomorrow, depending completely on the economic importance of the product.

Examples of joint products and by-products-

| SI. | Industry | Joint products | By-products |
| :--- | :--- | :--- | :--- |
| $\mathbf{1}$ | Dairy | Skim milk, cream, butter, cheese | Whey and other products |
| $\mathbf{2}$ | Petroleum refinery | ATF, Kerosene and Naphtha, etc. | Paraffin, tar, oil cakes, etc. |
| $\mathbf{3}$ | Flour milling | Patent flour, clear flour | Bran, wheat germs |
| $\mathbf{4}$ | Rice milling | Patent rice | Rice husk, rice oil, etc. |
| $\mathbf{5}$ | Soap manufacturing | Soap of different varieties | Glycerine |

## ACCOUNTING FOR JOINT PRODUCTS

## PHYSICAL UNITS METHODS

Example-1
One tonne of raw material put, into a common process yields four joint products $P, Q, R$ and $S$ their weights being $63 \mathrm{kgs}, 117 \mathrm{kgs}, 180 \mathrm{kgs}$, and 540 kgs. Respectively. The balance in weight is considered as normal wastage.

Based on the total processing cost of Rs.20,000 per tonne of raw material input, you are required to apportion the joint cost to the products $P, Q, R$ and $S$

Solution:
Statement showing apportionment of joint cost among the joint cost among the joint product $P, Q, R$ and $S$ for the period.....

| Products | Output (kgs.) | Basis Of Apportionment | Share Of Joint Cost |
| :--- | :---: | :---: | :---: |
| P | 63 | $63 / 900 \times 20,000$ | 1400 |
| Q | 117 | $117 / 900 \times 20,000$ | 2,600 |
| $R$ | 180 | $180 / 900 \times 20,000$ | 4,000 |
| S | $540 / 900 \times 20,000$ | $\underline{12,000}$ |  |
| total output | 900 |  | 20,000 |
| Normal wastage | 100 | $\underline{N I L}$ |  |
| Total input | $\underline{1,000}$ | $\underline{20,000}$ |  |

Working notes: (a) here wastage of 100 kgs. Is purely a normal loss. Its cost is charged over the goods units produced as joint products.
(b) the basis of apportionment of common cost for a joint products.

Joint products $=\frac{\text { Particulars output }}{\text { Total output }} X$ total joint product

## SURVEY METHOD

## Example-2

Sunlight manufacturing company produce four products jointly - K,L,M and N. the common cost incurred upto split-off point for the $3^{\text {rd }}$ quarter of year 2018-19 includes: direct material-Rs.60,000, direct wages-Rs.40,000, overhead charges Rs.50,000.
The quantities of output for the joint product for the same period are-
K-5,000 units; L-2,000 units; M-7,500 units; N-1,500 units. Through technical survey the points assigned for the output of four joint product are $3,5,8$ and 10 respectively.
Show your allocation of common costs among the joint products.
Step-1 total common cost incurred upto split-off point for joint product for the quarter ended $31^{\text {st }}$ dec 2019.
Direct material $=60,000$
Direct wages $=40,000$
Prime cost $=1,00,000$
Overhead charges $=50,000$
Total cost $\quad=\mathbf{1 , 5 0 , 0 0 0}$

| Produ <br> ct | Output | Point <br> assigned | Equivalent <br> units | Cost per <br> equivalent | Cost <br> apportioned | Cost per <br> unit |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| (1) | (2) Units | $(3)$ | $(4)=(2) \times(3)$ | (5) Rs. | $(6)=(4) \times(5)$ | $(7)=(3) \times(5)$ |
| K | 5000 | 3 | 15,000 | 1.50 | 22,500 | 4.50 |
| L | 2000 | 5 | 10,000 | 1.50 | 15,000 | 7.50 |
| M | 7500 | 8 | 60,000 | 1.50 | 90,000 | 12.00 |
| N | 1500 | 10 | 15,000 | 1.50 | 22,500 | 15.00 |

## Contribution $=$ sales - variable cost

Example -3Star co. produces three joint products P,Q and R. The total common cost incurred for the month of july, 2019 for the jointproduct upto split-off point are as follows:
Direct material-30,000, direct labour-35,000, variable overhead-25,000; fixed overhead-54,000. the particulars relating to the
joint products are as follows:
Product P
Variable cost after split-off point (Rs.) 8
Selling price per unit(Rs.) 24
Output produced (units) 4,000
you are required to apportion the joint costs by contribution margin method and to compute the profit per unit of the joint
products.
Solution: statement showing calculation of variable cost per unit for pre-separation period
Particulars amount
Direct materials 30,000
Direct labour 35,000
Prime cost 65,000
Variable overhead 25,000
$\begin{array}{ll}\text { Total variable cost or marginal cost } & 90,000\end{array}$
$\begin{array}{lll}\text { Total output of joint products(units) } \quad[4,000+6,000+5,000] & 15,000\end{array}$
$\begin{array}{ll}\text { Variable cost per units } & 6.00\end{array}$

Statement showing contribution margin method, allocation of fixed cost and profit earned by the joint product for the month of july,2019

| products | Output <br> Produced | Preseparation variable cost p.u. | Post separation variable cost p.u. | Total variable cost | Selling price per unit | Contributi on per unit | Total contributi on | Total fixed cost allocated | Total profit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 2 | 3 | 4 | $\begin{gathered} 5= \\ (3+4) \end{gathered}$ | 6 | $\begin{gathered} 7= \\ (6-5) \end{gathered}$ | $\begin{gathered} 8= \\ (2 \times 7) \end{gathered}$ | 9 | $\begin{gathered} 10= \\ (8-9) \end{gathered}$ |
| P | 4,000 | 6.00 | 8.00 | 14 | 24 | 10 | 40,000 | 24,000 | 16,000 |
| Q | 6,000 | 6.00 | 5.00 | 11 | 16 | 5 | 30,000 | 18,000 | 12,000 |
| R | 5,000 | 6.00 | 4.00 | 10 | 14 | 4 | 20,000 | 12,000 | 8,000 |

Here, contribution margin ratio of the three joint product $P, Q$ and $R=40,000: 30,000: 20,000=4: 3: 2$
So, share of total fixed cost allocation for the joint product $P$ on the basis of contribution margin
$=\frac{\text { Contribution of } P}{\text { Total contribution }} \quad$ *total fixed overhead
Share of fixed cost
$\mathrm{P}=4 / 9 \times 54,000=24,000$
$\mathrm{Q}=3 / 9 \times 54,000=18,000$
$R=2 / 9 \times 54,000=12,000$

## MARKET VALUE METHOD:

(a) Market value at separation point;
(b) Market value after further processing;
(c) Net realisable value, or reverse cost method.

Example-4 In a concern engaged in process industry, four products emerge from a particular process of operation. The total cost of input for the period ended $30^{\text {th }}$ sept 2019 is Rs. 253500 . the detail of output, additional cost after split off point and sales value of products are appended below:

| Products | output | Additional processing cost after split off point | Sales value |
| :--- | :--- | :--- | :--- |
| A | 8,000 | 60,000 | $1,68,000$ |
| B | 5,000 | 10,000 | $1,10,000$ |
| C | 3,000 | - | 60,000 |
| D | 4,000 | 20,000 | 90,000 |

If the products are sold at the split off point without further processing, the sales value would have been
A-1,15,000
B-90,000
C-55,000
D-80,000
You are required to prepare a statement of profitability based on the product being sold (I) after further processing and (II) at the split off point.

## SOLUTION:

(i) Allocation of total common cost among the joint products on the basis of the products sold after further processing. Here, equivalent sales value at split-off point= after processing sales values - additional processing cost after split-off point. This basis is used for the apportionment of common pre separation cost by using the following formula:-
Share of common cost for a product
$=\frac{\text { Equivalent sales value for the product }}{\text { Total equivalent sales value }} \mathrm{X}$ total common cost
Statement showing apportionment of pre-split-off common cost and profitability of the joint products if sold after further processing for the period ended on $30^{\text {th }}$ sept 2019:-

| Joint product | Output(units) | After processing <br> sales value | Additional <br> processing cost <br> after split-off | Equivalent sales <br> value at split off <br> point | Share of joint <br> cost | Profit earned |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| A | $\mathbf{8 , 0 0 0}$ | $\mathbf{1 , 6 8 , 0 0 0}$ | $\mathbf{6 0 , 0 0 0}$ | $\mathbf{1 , 0 8 , 0 0 0}$ | $\mathbf{8 1 , 0 0 0}$ | $\mathbf{2 7 , 0 0 0}$ |
| B | $\mathbf{5 , 0 0 0}$ | $\mathbf{1 , 1 0 , 0 0 0}$ | $\mathbf{1 0 , 0 0 0}$ | $\mathbf{1 , 0 0 , 0 0 0}$ | $\mathbf{7 5 , 0 0 0}$ | $\mathbf{2 5 , 0 0 0}$ |
| C | $\mathbf{3 , 0 0 0}$ | $\mathbf{6 0 , 0 0 0}$ | - | $\mathbf{6 0 , 0 0 0}$ | $\mathbf{4 5 , 0 0 0}$ | $\mathbf{1 5 , 0 0 0}$ |
| D | $\mathbf{4 , 0 0 0}$ | $\mathbf{9 0 , 0 0 0}$ | $\mathbf{2 0 , 0 0 0}$ | $\mathbf{7 0 , 0 0 0}$ | $\mathbf{5 2 , 5 0 0}$ | $\mathbf{1 7 , 5 0 0}$ |
| TOTAL | $\mathbf{2 0 , 0 0 0}$ | $\mathbf{4 , 2 8 , 0 0 0}$ | $\mathbf{9 0 , 0 0 0}$ | $\mathbf{3 , 3 8 , 0 0 0}$ | $\mathbf{2 , 5 3 , 5 0 0}$ | $\mathbf{8 4 , 5 0 0}$ |

(ii) Allocation of total common cost among the joint products on the basis of the products sold at the split off point: Here, the sales value of the joint products, if sold at the split-off point is given in the question. This basis is used for apportionment of the common pre separation cost by using the following formula:
Share of common cost for a product
Split-off point sales value for the product
Total sales value at split-off point
Statement showing apportionment of pre-split common cost and profitability of the joint products if sold at the split off point for the period ended on $30^{\text {th }}$ sept 2019:-

| Joint product | Output | Sales value at split-off point | Share of joint cost | Profit earned |
| :---: | :---: | :---: | :---: | :---: |
| A | 8,000 | 1,15,000 | 85,743 | 29,257 |
| B | 5,000 | 90,000 | 67,103 | 22,897 |
| C | 3,000 | 55,000 | 41,007 | 13,993 |
| D | 4,000 | 80,000 | 59,647 | 20,353 |
| TOTAL | 20,000 | 3,40,000 | 2,53,500 | 86,500 |

## ACCOUNTING FOR BY-PRODUCT

B Itd. Manufacturing product A which yields two by-product B and C . The actual joint expenses of manufacturing for a period were Rs. 8,000 . it was estimated that the profits on each product as a percentage of sales, would be $30 \%, 25 \%$ and $15 \%$ respectively. Subsequent expenses were:-

| Particulars | A(Rs.) | B(Rs.) | C(Rs.) |
| :--- | :--- | :--- | :--- |
| Materials | 100 | 75 | 25 |
| Direct wages | 200 | 125 | 50 |
| Overhead | 150 | 125 | 75 |
|  | 450 | 325 | 150 |
| Sales | 6,000 | 4,000 | 2,500 |

Prepare a statement showing the apportionment of the joint expenses of manufacture over the different products.

## Solution :

Working notes:-
Here, total costs of the products $=4,200+3,000+2,125=9,325$. but total production costs $=$ costs of pre-separation/common cost+ subsequent total expenses $=8,000+(450+325+150)=8,925$. so, extra expenses $=9,325-8,925=400$ may be assumed as selling expenses. It is apportioned in the ratio of sales.

Statement showing the apportionment of the joint expenses of manufacture over the main product and the by products for the period.

| Particulars | Main product A | By product |  | Total |
| :--- | :--- | :--- | :--- | :--- |
|  |  | B | C |  |
| Sales | 6,000 | 4,000 | 2,500 | 12,500 |
| Less: profit | $30 \%$ on sales = 1,800 | $25 \%$ on sales $=1,000$ | $15 \%$ on sales $=375$ | 3,175 |
| Total cost/ cost of sales | $\mathbf{4 , 2 0 0}$ | $\mathbf{3 , 0 0 0}$ | $\mathbf{2 , 1 2 5}$ | $\mathbf{9 , 3 2 5}$ |
| Less: selling expenses(WN) | 192 | 128 | 80 | 400 |
| Production cost | $\mathbf{4 , 0 0 8}$ | $\mathbf{2 , 8 7 2}$ | $\mathbf{2 , 0 4 5}$ | $\mathbf{8 , 9 2 5}$ |
| Less: subsequent expenses <br> (i.e., cost of further <br> processing) <br> Share of joint/ common <br> costs | 450 | 325 | 150 | $\mathbf{9 2 5}$ |
